

Dinosaurs by Noah

There used to be lots of dinosaurs long ago. There are 3 different types of dinosaurs that I'm talking about the T-rex, Ankylosaurus and Brachiosaurus. There are many characteristics of dinosaurs. I am going to talk about their

size, habitat, food,
and bones. So first
up the Tyrannosaurus
(T-rex). The first bone
found was in Colorado
in 1874. It was
about 18 feet long
and about 12 feet
tall and weighed 15,000
pounds. It had
a massive skull

that was thick for
crushing. It had tiny arms.
It lived during the
cretaceous period in north
america. It ate dead
stuff. The T-rex was a
carnivore, it chased it's
prey with it's super
strong legs. It killed it's
prey with very sharp
teeth. It evolved into

modern birds (chicken).

The long necked, big
manne, and its a reptile
the Brachiosaurus!!! The
first bone found was in
Colorado, 1900. Its size
is about 45 feet,
it walked on 4 legs
and it liked to walk
on solid ground. It
was a herbivore

which means it ate
ferns, trees, and leaves. It
swallowed it's food whole.

The giraffe evolved
from the Brachiosaurus
because they eat the
same way, and last but
not least the
Ankylosaurus!!!! the
Ankylosaurus is the
biggest and heaviest

of all the armored
dinosaurs. It roamed
during the cretaceous
period. It lived about
65 million years ago.
It was a herbivore
which means it
eats ferns, leaves,
and plants. Ankylosaurus
would swing it's tail
if anything tried to

attack. The first fossil
found was found in 1906 in
Montana. These three
dinosaurs roamed lots of
millions of years ago but
its like they're still
here!!!! so technically
they are still here!!
The end.
